

## **CLAIM AMENDMENTS**

### **Claim Amendment Summary**

#### **Claims pending**

- Before this Amendment: Claims 1-16, 41-50, and 66-85
- After this Amendment: Claims 1-16, 41-50, and 66-85

**Non-Elected, Canceled, or Withdrawn claims:** None

**Amended claims:** 1, 6-9, 41, 44, 68, 71-76, and 78-80

**New claims:** None

---

### **Claims:**

1. (currently amended) A pipeline accelerator, comprising:  
a memory; and  
a hardwired-pipeline circuit coupled to the memory, including at least one processing pipeline, and operable to[[.]] :  
receive a message that includes data and that includes a header having information indicating a destination of the data by receiving the data and the information on at least one common bus line,  
extract the data from the message,  
load the extracted data into the memory,  
retrieve the extracted data from the memory,  
process the retrieved data with a pipeline corresponding to the destination without executing a program instruction, and  
provide the processed data to an external source.

2. (original) The pipeline accelerator of claim 1 wherein:  
the memory is disposed on a first integrated circuit; and  
the pipeline circuit is disposed on a second integrated circuit.
3. (original) The pipeline accelerator of claim 1 wherein the pipeline circuit  
is disposed on a field-programmable gate array.
4. (original) The pipeline accelerator of claim 1 wherein the pipeline circuit  
is operable to provide the processed data to the external source by:  
loading the processed data into the memory;  
retrieving the processed data from the memory; and  
providing the retrieved processed data to the external source.
5. (original) The pipeline accelerator of claim 1 wherein:  
the external source comprises a processor; and  
the pipeline circuit is operable to receive the data from the processor.
6. (currently amended) A computing machine, comprising:  
a processor operable to broadcast a message that includes data and that  
includes a header having information indicating a destination of the data; and  
a pipeline accelerator coupled to the processor and comprising,  
a memory, and  
a hardwired-pipeline circuit coupled to the memory, including at least  
one processing pipeline, and operable to:  
receive the message from the processor by receiving the data  
and the information via at least one same bus line,  
extract the data from the message,  
load the extracted data into the memory,  
retrieve the extracted data from the memory,

process the retrieved data with a pipeline corresponding to the destination without executing a program instruction, and  
provide the processed data to the processor.

7. (currently amended) A pipeline accelerator, comprising:

a memory; and

a hardwired-pipeline circuit coupled to the memory and operable to[[.]] :

receive data,

process the received data without executing a program instruction,

load the processed data into the memory,

retrieve the processed data from the memory,

generate a message header that includes first information indicating  
a destination of the processed data;

generate a message that includes the processed data and the  
header; and

provide the message to an external source.

8. (currently amended) A computing machine, comprising:

a processor operable to run at least one software application; and

a pipeline accelerator coupled to the processor and comprising[[.]] :

a memory, and

a hardwired-pipeline circuit coupled to the memory and operable to,

receive data from the processor,

process the received data without executing a program  
instruction,

load the processed data into the memory,

generate a message header that includes, for the processed data, information that indicates a destination software application running on the processor,  
retrieve the processed data from the memory,  
generate a message that includes the retrieved processed data and the message header, and  
provide the message to the processor.

9. (currently amended) A pipeline accelerator, comprising:  
first and second memories; and  
a hardwired-pipeline circuit coupled to the first and second memories and comprising[[,.]] :

an input-data handler operable to receive from an external source a first message that includes raw data and that includes a first header having information indicating a destination of the raw data, to extract the raw data from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first memory, provide the retrieved raw data to a hardwired pipeline corresponding to the destination, and load processed data from the hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from the second memory, to generate a second header having first information indicating a destination of the processed data, to generate a second message that includes the processed data and the second header, and to provide the second message to the external source by providing the processed data and the first information to the external source via at least one same bus line.

10. (original)The pipeline accelerator of claim 9 wherein:

the first and second memories each include respective first and second ports;

the input-data handler is operable to load the raw data via the first port of the first memory,

the pipeline interface is operable to retrieve the raw data via the second port of the first memory and to load the processed data via the first port of the second memory, and

the output-data handler is operable to retrieve the processed data via the second port of the second memory.

11. (original)The pipeline accelerator of claim 9, further comprising:

a third memory coupled to the hardwired-pipeline circuit;

wherein the hardwired pipeline is operable to generate intermediate data while processing the raw data; and

wherein the pipeline interface is operable to load the intermediate data into the third memory and to retrieve the intermediate data from the third memory.

12. (original)The pipeline accelerator of claim 9 wherein:

the first and second memories are respectively disposed on first and second integrated circuits; and

the pipeline circuit is disposed on a field-programmable gate array.

13. (original)The pipeline accelerator of claim 9, further comprising:

an input-data queue coupled to the input-data handler and the pipeline interface;

wherein the input-data handler is operable to load into the input-data queue a pointer to a location of the raw data within the first memory; and

wherein the pipeline interface is operable to retrieve the raw data from the location using the pointer.

14. (original)The pipeline accelerator of claim 9, further comprising:  
an output-data queue coupled to the output-data handler and the pipeline interface;

wherein the pipeline interface is operable to load into the output-data queue a pointer to a location of the processed data within the second memory;  
and

wherein the output-data handler is operable to retrieve the processed data from the location using the pointer.

15. (original)The pipeline accelerator of claim 9, further comprising:  
wherein each of the input-data handler, hardwired pipeline, pipeline interface, and output-data handler has a respective operating configuration; and  
a configuration manager coupled to and operable to set the operating configurations of the input-data handler, hardwired pipeline, pipeline interface, and output-data handler.

16. (original)The pipeline accelerator of claim 9, further comprising:  
wherein each of the input-data handler, hardwired pipeline, pipeline interface, and output-data handler has a respective operating status; and  
an exception manager coupled to and operable to identify an exception in the input-data handler, hardwired pipeline, pipeline interface, or output-data handler in response to the operating statuses.

17. – 40. Cancelled.

41. (currently amended) A method, comprising:  
receiving a message that includes data and that includes a header having information indicating a destination of the data and having information indicating a size of the message;  
extracting the data from the message;  
loading the extracted data into a memory;  
retrieving the extracted data from the memory;  
processing the retrieved data with a hardwired-pipeline circuit that corresponds to the destination of the data without executing a program instruction; and  
providing the processed data to an external source.

42. (original)The method of claim 41 wherein providing the processed data comprises:

loading the processed data into the memory;  
retrieving the processed data from the memory; and  
providing the retrieved processed data to the external source.

43. (previously presented) A method, comprising:  
processing data with a hardwired-pipeline circuit without executing a program instruction;

loading the processed data into a memory;  
retrieving the processed data from the memory;  
generating a header having first information indicating a destination of the processed data;  
forming a message from the header and the processed data; and  
providing the message to an external source via a single bus.

44. (currently amended) A method, comprising:

receiving from an external source a first message that includes raw data and that includes a first header having information indicating a destination of the raw data;

extracting the raw data from the message;

loading the extracted raw data into a first memory;

retrieving the extracted raw data from the first memory;

processing the retrieved data with a hardwired pipeline without executing a program instruction;

loading the processed data from the hardwired pipeline into a second memory;

generating a second header having information indicating a destination of the processed data;

retrieving the processed data from the second memory;

generating a second message that includes the processed data and the second header; and

providing the second message to the external source by providing the processed data and the information to the external source via at least one same bus line.

45. (original)The method of claim 44 wherein:

loading the raw data comprises loading the raw data via a first port of the first memory;

retrieving the raw data comprises retrieving the raw data via a second port of the first memory;

loading the processed data comprises loading the processed data via a first port of the second memory; and

providing the processed data comprises retrieving the processed data via a second port of the second memory.

46. (original)The method of claim 44, further comprising:  
generating intermediate data with the hardwired pipeline in response to processing the raw data;  
loading the intermediate data into a third memory; and  
providing the intermediate data from the third memory back to the hardwired pipeline.

47. (original)The method of claim 44, further comprising:  
loading into an input-message queue a pointer to a location of the raw data within the first memory; and  
wherein retrieving the raw data comprises retrieving the raw data from the location using the pointer.

48. (original)The method of claim 44, further comprising:  
loading into an output-message queue a pointer to a location of the processed data within the second memory; and  
wherein retrieving the processed data comprises retrieving the processed data from the location using the pointer.

49. (original)The method of claim 44, further comprising setting parameters for loading and retrieving the raw data, processing the retrieved data, and loading and providing the processed data.

50. (original)The method of claim 44, further comprising determining whether an error occurs during the loading and retrieving of the raw data, the processing of the retrieved data, and the loading and providing of the processed data.

51. – 65. Cancelled.

66. (previously presented) The pipeline accelerator of claim 1 wherein the hardwired-pipeline circuit is further operable to:

extract from the header the information indicating the destination of the data;

generate from the extracted information an identifier that identifies the pipeline corresponding to the destination;

store the identifier in association with the data; and

provide the retrieved data to the pipeline in response to the stored identifier.

67. (previously presented) The pipeline accelerator of claim 1 wherein the hardwired-pipeline circuit is further operable to:

extract from the header the information indicating the destination of the data;

generate from the extracted information an identifier that identifies the pipeline corresponding to the destination;

store a pointer to the extracted data;

store the identifier in association with the pointer; and

provide the retrieved data to the pipeline in response to the stored pointer and identifier.

68. (currently amended) A pipeline accelerator, comprising:

a memory; and

a hardwired-pipeline circuit coupled to the memory, including at least one processing pipeline, and operable to[[.]] :

receive a message that includes data and that includes a header having information indicating a destination of the data,

extract the data from the message,

load the extracted data into the memory,  
retrieve the extracted data from the memory,  
process the retrieved data with a pipeline corresponding to the destination without executing a program instruction,  
provide the processed data to an external source,  
extract from the header the information indicating the destination of the data,  
store a pointer to the extracted data in a location associated with the pipeline corresponding to the destination, and  
provide the retrieved data to the pipeline in response to the stored pointer.

69. (previously presented) The pipeline accelerator of claim 7 wherein the hardwired-pipeline circuit is further operable to:

store in association with the processed data second information indicating the destination of the processed data;  
generate the message header in response to the second information.

70. (previously presented) The pipeline accelerator of claim 69 wherein the second information equals the first information.

71. (currently amended) A pipeline accelerator, comprising:

a memory; and

a hardwired-pipeline circuit coupled to the memory and operable to [(.)] :

receive data,

process the received data without executing a program instruction,

load the processed data into the memory,

retrieve the processed data from the memory,

generate a message header that includes first information indicating a destination of the processed data,  
generate a message that includes the processed data and the header,  
provide the message to an external source,  
store a pointer to the processed data,  
store in association with the pointer second information indicating the destination of the processed data,  
retrieve the processed data in response to the pointer, and  
generate the message header in response to the second information.

72. (currently amended) A pipeline accelerator, comprising:

a memory; and

a hardwired-pipeline circuit coupled to the memory and operable to[[,.]] :

receive data,  
process the received data without executing a program instruction,  
load the processed data into the memory,  
retrieve the processed data from the memory,  
generate a message header that includes first information indicating a destination of the processed data,  
generate a message that includes the processed data and the header,  
provide the message to an external source,  
store a pointer to the processed data in a location associated with the destination of the processed data,  
retrieve the processed data in response to the pointer, and  
generate the message header in response to the location.

73. (currently amended) The pipeline accelerator of claim 9 wherein:  
the input-data handler is further operable to[[,]] :

extract from the header the information indicating the destination of  
the data,

generate from the extracted information an identifier that identifies  
the pipeline corresponding to the destination, and

store the identifier in association with the data; and

wherein the pipeline interface is further operable to provide the retrieved  
data to the pipeline in response to the stored identifier.

74. (currently amended) A pipeline accelerator, comprising:

first and second memories; and

a hardwired-pipeline circuit coupled to the first and second memories and  
comprising[[,]] :

an input-data handler operable to receive from an external source a  
first message that includes raw data and that includes a first header having  
information indicating a destination of the raw data, to extract the raw data  
from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without  
executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first  
memory, provide the retrieved raw data to a hardwired pipeline  
corresponding to the destination, and load processed data from the  
hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from  
the second memory, to generate a second header having first information  
indicating a destination of the processed data, to generate a second  
message that includes the processed data and the second header, and to  
provide the second message to the external source,

wherein the input-data handler is further operable to,  
extract from the header the information indicating the destination of the data,  
generate from the extracted information an identifier that identifies the pipeline corresponding to the destination,  
store a pointer to the extracted data, and  
store the identifier in association with the pointer; and  
wherein the pipeline interface is further operable to provide the retrieved data to the pipeline in response to the stored pointer and identifier.

75. (currently amended) A pipeline accelerator, comprising:  
first and second memories; and  
a hardwired-pipeline circuit coupled to the first and second memories and comprising[[.]] :

an input-data handler operable to receive from an external source a first message that includes raw data and that includes a first header having information indicating a destination of the raw data, to extract the raw data from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first memory, provide the retrieved raw data to a hardwired pipeline corresponding to the destination, and load processed data from the hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from the second memory, to generate a second header having first information indicating a destination of the processed data, to generate a second message that includes the processed data and the second header, and to provide the second message to the external source;

wherein the input-data handler is further operable to,  
extract from the header the information indicating the destination of the data, and  
store a pointer to the extracted data in a location associated with the pipeline corresponding to the destination; and  
wherein the pipeline interface is further operable to provide the retrieved data to the pipeline in response to the stored pointer.

76. (currently amended) A pipeline accelerator, comprising:  
first and second memories; and  
a hardwired-pipeline circuit coupled to the first and second memories and comprising[[,]] :

an input-data handler operable to receive from an external source a first message that includes raw data and that includes a first header having information indicating a destination of the raw data, to extract the raw data from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first memory, provide the retrieved raw data to a hardwired pipeline corresponding to the destination, and load processed data from the hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from the second memory, to generate a second header having first information indicating a destination of the processed data, to generate a second message that includes the processed data and the second header, and to provide the second message to the external source;

wherein the pipeline interface is further operable to store in association with the processed data second information indicating the destination of the processed data; and

wherein the output-data handler is further operable to generate the first information from the second information.

77. (previously presented) The pipeline accelerator of claim 76 wherein the second information equals the first information.

78. (currently amended) A pipeline accelerator, comprising:  
first and second memories; and  
a hardwired-pipeline circuit coupled to the first and second memories and comprising[[,.]] :

an input-data handler operable to receive from an external source a first message that includes raw data and that includes a first header having information indicating a destination of the raw data, to extract the raw data from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first memory, provide the retrieved raw data to a hardwired pipeline corresponding to the destination, and load processed data from the hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from the second memory, to generate a second header having first information indicating a destination of the processed data, to generate a second message that includes the processed data and the second header, and to provide the second message to the external source;

wherein the pipeline interface is further operable to

store a pointer to the processed data, and  
store in association with the pointer second information indicating the  
destination of the processed data; and  
wherein the output-data handler is further operable to  
retrieve the processed data in response to the pointer, and  
generate the first information from the second information.

79. (currently amended) A pipeline accelerator, comprising:  
first and second memories; and  
a hardwired-pipeline circuit coupled to the first and second memories and  
comprising[.],.];

an input-data handler operable to receive from an external source a  
first message that includes raw data and that includes a first header having  
information indicating a destination of the raw data, to extract the raw data  
from the message, and to load the raw data into the first memory,

at least one hardwired pipeline operable to process data without  
executing a program instruction,

a pipeline interface operable to retrieve the raw data from the first  
memory, provide the retrieved raw data to a hardwired pipeline  
corresponding to the destination, and load processed data from the  
hardwired pipeline into the second memory, and

an output-data handler operable to retrieve the processed data from  
the second memory, to generate a second header having first information  
indicating a destination of the processed data, to generate a second  
message that includes the processed data and the second header, and to  
provide the second message to the external source;

wherein the pipeline interface is operable to store a pointer to the  
processed data in a location associated with destination of the processed data;  
and

wherein the output-data handler is further operable to  
retrieve the processed data in response to the pointer, and  
generate the first information in response to the location.

80. (currently amended) The method of claim 41, further comprising:  
extracting from the header the information indicating the destination of the  
data;

generating from the extracted information an identifier that identifies the  
hardwired-pipeline circuit corresponding to the destination;  
storing the identifier in association with the data; and  
~~provide~~ providing the retrieved data to the hardwired-pipeline circuit in  
response to the stored identifier.

81. (previously presented) A method, comprising:  
receiving a message that includes data and that includes a header having  
information indicating a destination of the data;

extracting the data from the message;  
loading the extracted data into a memory;  
retrieving the extracted data from the memory;

processing the retrieved data with a hardwired-pipeline circuit that  
corresponds to the destination of the data without executing a program  
instruction;

providing the processed data to an external source;  
extracting from the header the information indicating the destination of the  
data;

generating from the extracted information an identifier that identifies the  
hardwired-pipeline circuit corresponding to the destination;

storing a pointer to the extracted data;  
storing the identifier in association with the pointer; and

providing the retrieved data to the hardwired-pipeline circuit in response to the stored pointer and identifier.

82. (previously presented)      A method, comprising:  
receiving a message that includes data and that includes a header having information indicating a destination of the data;  
extracting the data from the message;  
loading the extracted data into a memory;  
retrieving the extracted data from the memory;  
processing the retrieved data with a hardwired-pipeline circuit that corresponds to the destination of the data and without executing a program instruction;  
providing the processed data to an external source;  
extracting from the header the information indicating the destination of the data;  
storing a pointer to the extracted data in a location associated with the hardwired-pipeline circuit corresponding to the destination; and  
providing the retrieved data to the hardwired-pipeline circuit in response to the stored pointer.

83. (previously presented)      The method of claim 43, further comprising:  
storing in association with the processed data second information indicating the destination of the processed data; and  
wherein generating the header comprises generating the header in response to the second information.

84. (previously presented)      A method, comprising:  
processing data with a hardwired-pipeline circuit without executing a program instruction;

loading the processed data into a memory;  
retrieving the processed data from the memory;  
generating a header having first information indicating a destination of the processed data;  
forming a message from the header and the processed data;  
providing the message to an external source;  
storing a pointer to the processed data;  
storing in association with the pointer second information indicating the destination of the processed data;  
retrieving the processed data in response to the pointer; and  
wherein generating the header comprises generating the header in response to the second information.

85. (previously presented) A method, comprising:  
processing data with a hardwired-pipeline circuit without executing a program instruction;  
loading the processed data into a memory;  
retrieving the processed data from the memory;  
generating a header having first information indicating a destination of the processed data;  
forming a message from the header and the processed data;  
providing the message to an external source;  
storing a pointer to the processed data in a location associated with the destination of the processed data;  
retrieving the processed data in response to the pointer; and  
wherein generating the header comprises generating the header in response to the location.
